

My homework is a data record that can output several students. The Python code is used, and I have included class variables, data variables, and get-set methods. After starting the program, there will be a basic introduction to this lesson, including the course name (CSE-20-03), course title (Beginning Programming in Python), assignment title (Assignment 10.1: Your Own Class), and teacher (Teacher: Harikrishna Kuttivelil), time (fall quarter 2021) and school name (University of California, Santa Cruz). Then you will enter the program's menu, and then you need to enter 1, and follow the steps to enter Assignment name, student name, student id and student grades in turn. After completion, it will return to the program menu again. At this time, you need to enter 2, and you will be asked to fill in the student id to view all the information you just entered. After viewing, you will return to the program menu. If you want to exit, you can choose to enter 4.
